October 19, 2026

To whom it may concern,

I lead the Solutions Engineering team at Corintis, which translates customer requirements into topology-optimized microfluidic cooling solutions for high TDP microchips, at the intersection of simulation, optimization and software. Trained as a mechanical and aerospace engineer, I specialized in computational fluid dynamics through my Ph.D. at Institut de Mécanique des Fluides de Toulouse, a background that lies at the core of the simulation and optimization work my team carries out. I am pleased to recommend Gaëlle Gilardot, who worked under my supervision as an Associate Solutions Engineer during a fixed six-month engagement in 2026.

Gaëlle joined us with a broad set of goals spanning simulation, automation, internal tooling and software development for our computational tools. Over the course of her time at Corintis, her greatest strength emerged clearly: computational software development. She quickly became proficient with our scripting environment, simulation pipelines and in-house tools, and she naturally gravitated towards automating repetitive work.

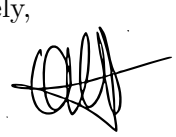

Her main contribution was her work on the optimizers that power our internal topology optimization tool, one of the core pieces of technology our engineers rely on every day. Gaëlle took ownership of improving the optimization routines behind this tool, working in a complex and numerically demanding codebase, and delivered improvements that the team continues to build on. She approached the work methodically, wrote clean and maintainable code, and integrated her changes in close collaboration with the developers and engineers who use the tool on a daily basis.

Gaëlle concluded this work with an outstanding internal presentation, in which she explained the motivation, the technical approach and the results of her optimizer developments. The presentation was clear, well structured and pitched at the right level for a mixed audience spanning company leadership, engineers and software developers, and it reflected genuine ownership of her work.

Her learning agility is among her most notable strengths: she absorbs new concepts and tools remarkably fast, and of all the dimensions we track in our internal growth framework, this is where she progressed the most during her time with us. Moreover, Gaëlle worked smoothly with colleagues across software, R&D and engineering, and her positive attitude, curiosity and eagerness to take on challenging technical problems made her a pleasure to work with.

In conclusion, her time with us made it clear that her talents are best expressed in software development, and I am confident that she will flourish in a role centered on scientific computing, numerical optimization or engineering tooling, where her coding skills and her ability to learn quickly can make the biggest difference. For these reasons, I strongly recommend Gaëlle for such positions, and I would be happy to discuss her work in more detail.

Sincerely,

Thanos Boutsikakis, Ph.D.
Solutions Engineering Manager
